RunX allows you to start any executable program as a user with a specific set of privileges (basically, you can start a program with the current user or as the administrator). These privileges determine which Windows features the program has access to. You can launch the program as a regular user, as the system user (the logged in user), or as an administrator. The latter, the TrustedInstaller, gives your program control over the entire operating system. Basically, the program launches itself with the highest privileges it can get. This can be used to run a program with the highest privileges it can possibly get (the system user), an executable with system privileges, or a program as administrator. Important: when RunX uses the console or right-click menu, the program launches with the highest privileges it can possibly get, which is most likely not the one you want. When launching a process with RunX, you can use these options to control the rights the process will have: • **User** – The rights the process will have when started with RunX. • **System** – The rights the process will have when started with RunX. • **Admin** – The rights the process will have when started with RunX. • **Current User** – The rights the process will have when started with RunX. Command-line arguments You can use any argument you can pass to the Windows executable to configure the process. See below for the syntax for some of the most important arguments. • **/arguments** – Pass arguments to the program. • **/args** – Pass arguments to the program. • **/file** – Execute a file instead of the executable. • **/log** – Execute a program in the foreground and capture its output. • **/logger** – Execute a program in the foreground and capture its output. • **/logfile** – Execute a program in the foreground and capture its output. • **/NoLog** – Do not log the output of the executable. • **/quiet** – Do not log the output of the executable. • **/start** – Pass arguments to the process when it is launched. • **/suspend** – Suspend the process when it is launched. • **/stop** – Stop the process when it is launched. • **/timeout** – Set the time the process will be run
