You can use it to paint over parts of an image, or to pull out parts from a block of color. It's a quick and simple method to correct problems in your image that can't be corrected or seen on the regular view. **Figure 1.1** The Eraser tool Every graphics program has a way to merge images. Photoshop's merge tool is located in the File menu, and is often a much quicker option for merging two images than going back to the more direct method of pasting them into an image editor. In addition, Photoshop allows you to lock parts of an image so that they don't move when you paste it into a different area. The two most common ways to combine images are `_merge transparent_` and `_stitch_`. The transparent setting sets both layers to Alpha Transparency (white is the background of the new image; the original image remains unedited). The other option, `_stitch_`, combines the layers to create a new layer. When the new layer is visible, only the result of merging the two images appears. This option is useful if you want to create a composite image. You can combine multiple layers using various methods. The simplest method is to combine all the layers at once. Another is to combine two layers. You can adjust the color of a layer; then, once you've finished, switch to another layer and reduce the opacity until the combined layer is no longer visible. Finally, you can combine several layers and adjust them individually before combining them. You can use any of these methods to create a new layer.

Conventional ground fault interrupter (GFI) circuits for indicating a fault condition in an electrical power system may include at least one power receptacle which is electrically connected to the power system. A GFI circuit is generally electrically connected to the power receptacle and an electrical load so as to indicate a fault condition in the power system when the current through the power receptacle drops below a predetermined level. Typically, a GFI circuit is connected in parallel with the power receptacle and the electrical load. In operation, GFI circuits typically include a metal oxide semiconductor field effect transistor (MOSFET) or a silicon-controlled rectifier (SCR) which provides a short circuit path between the power receptacle and ground when a fault condition is detected. When a fault condition is detected, a large transient current may be drawn by the GFI circuit which may damage the GFI circuit. Furthermore, the large transient current may cause instability in voltage provided by a power system. Accordingly, safety systems are often used in order to limit the current draw of a GFI circuit during a fault condition. Many conventional GFI circuits use a metal oxide semiconductor field effect transistor (MOSFET) as the main switching device. MOSFETs have disadvantages such as charge leakage across the source and drain terminals. Additionally, the turn off time of the MOSFET may not be sufficiently fast which may result in arcing between the power receptacle and the load. In order to address the disadvantages of MOSFETs, some GFI circuits may use a SCR circuit as the main switching device. In such instances, a gate of the SCR is typically electrically driven so as to provide a low resistance connection between the output of a GFI circuit and ground. When a SCR is used as the main switching device of a GFI circuit, it is desirable to have the SCR remain in an on state until the fault condition is removed from the GFI circuit. In order to achieve this condition, high current limit fuses are commonly connected in parallel with the SCR. However, these fuses are subject to fail, and in many cases, they may become damaged when the GFI circuit is connected to a system. Accordingly, these fuses may require replacement. U.S. Pat. No. 5,689,057 to Tani discloses a large capacity power supply circuit, in which an SCR is connected in parallel with a first and second

I had to update the npm registry and it took several restarts before it worked. The only thing I did differently was using https instead of http. I hope this is helpful for anybody with the same issue, knowing that it is network/firewall issue.
